

Frontgate Perimeter Defense

Eliminate Spam and Viruses Before They Reach Your Network.

Email has enabled businesses to stay connected with customers and clients around the World. But this new medium also exposes companies and their employees to threats such as malicious viruses, identity theft, Trojans, worms and a seemingly endless amount of spam. Using dual anti-virus scanners, proprietary heuristics, URL filtering, fingerprinting, and reputation analysis, Frontgate's exclusive *Inhibit-SR*[™] filter technology identifies and blocks harmful email viruses and spam messages before they infiltrate the organization. Frontgate combines human intelligence with technology to ensure that our filters are accurate and continuously updated as new threats emerge.

Perimeter Protection Shields Your Critical Network Infrastructure.

Frontgate's Perimeter Defense Service protects Internet-facing mail servers by eliminating the threat from anonymous connections. Frontgate identifies and stops malicious traffic at the perimeter to ensure that your network is protected from directory harvest attempts, denial of service attacks, channel flooding, and mail bombs—Threats that can disable even the most robust mail systems.

Web-Based Quarantine Reduces Bandwidth and Storage Requirements.

Frontgate eases the task of managing unwanted email by quarantining suspect messages off-site and away from the business environment. Using a secure, web-based portal, Administrators can quickly review any blocked messages, release those that they believe are not spam and determine how similar items should be processed in the future. Quarantining unwanted messages off-site reduces bandwidth and storage requirements and increases the speed of your mail server.

Protection That Increases Productivity and Reduces Costs.

Studies show that decreasing the amount of unsolicited and infected email an enterprise receives provides an increase in worker productivity. Frontgate's around-the-clock Perimeter Defense Service is a cost-effective solution that's automatic, requires no additional software to purchase and can be activated rapidly and effortlessly.

Spam will account for 70% of all Internet email by 2007
